XIC - C08K-005/10 ; C08L-027/06

AB - J52150461 Process comprises adding 0.05-3 pts. wt. of ≥ 1 cpd. selected

from 12-22C higher fatty acid ester of pentaerythritol and or
dipentaerythritol, in which $>75\%$ of hydroxyl gp. in each erythritol
molecule has ester bond, to 100 pts. wt. of vinyl chloride resin.

- Though lead is not compounded in the compsn. it has the same
processability as the conventional compsn., in which lead is
compounded, is excellent in surface evaluation of the extruded
moulding and can prevent redn. of extruded amount and increase of
kneading resistance in extrusion moulding.

- As higher fatty acid 12-22c fatty acid is used regardless of
saturation or unsaturation. As satd. fatty acid, lauric acid,
palmitic acid, stearic acid, heptadecanoic acid, etc. are cited and as
unsatd. fatty acid, olefic acid, elaidic acid, linolic acid, etc., are
cited. The lubricant can be used along or together with other
lubricant such as polyethylene was as lubricant to various stabilisers
such as (Ca-Zn) metallic soap type, (Ba-Zn) metallic soap type,
organic tin type and epoxy type stabiliser. A rigid vinyl chloride
product such as pipe can be obtd.
